

# Search In File

## Installation Guide

Thanks for purchasing my Search In File program.

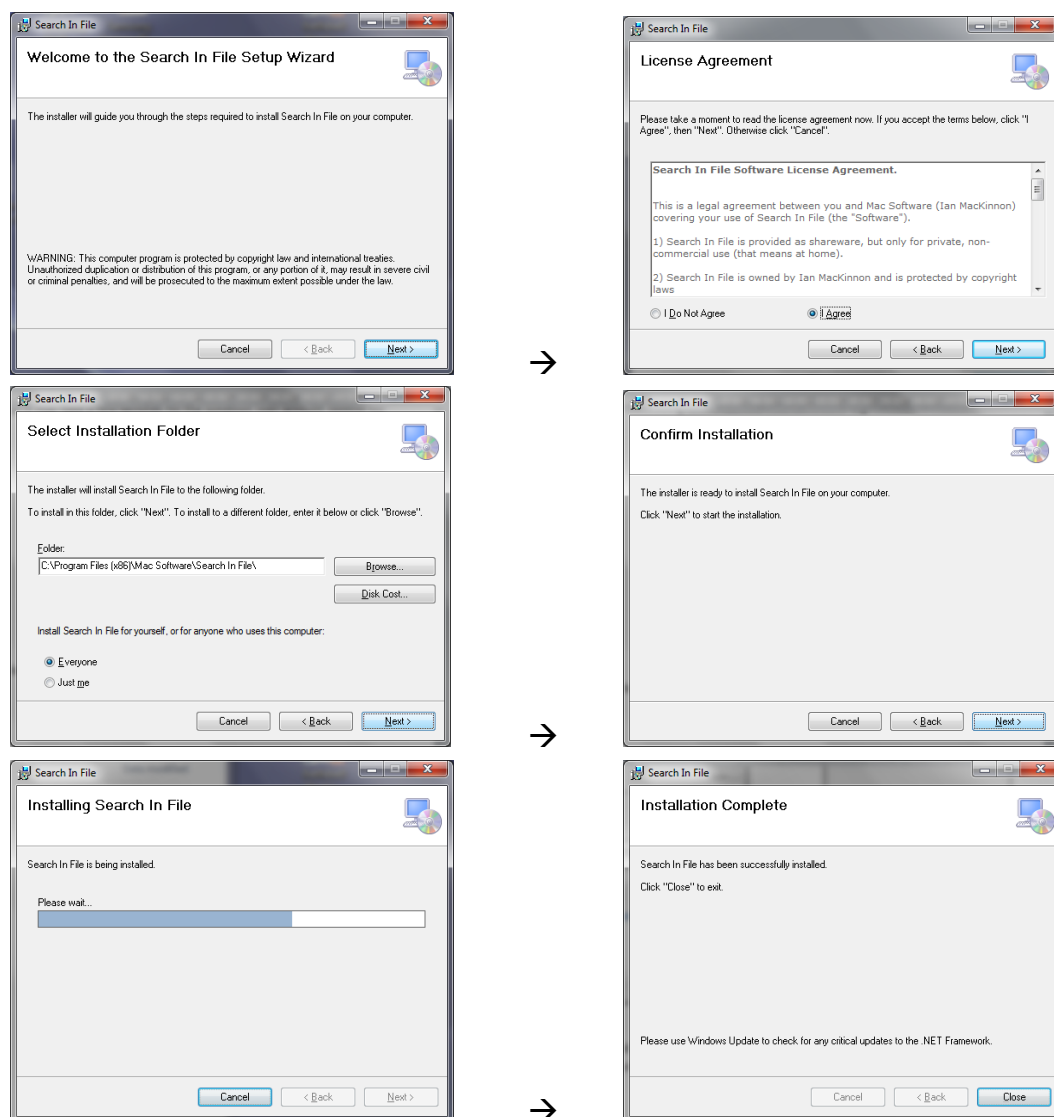

### Steps (Assuming you have the basic windows zip extractor):

1. You will need to save the file “Search In File v.##.##.zip” to your computer.
2. Locate where you saved the file and right click on it. Depending on the software you have installed to unzip files you will either see “Extract All” or “Unzip” or something along those lines, select that. A new window will open; click next, then next again. That should have extracted the files into the same location and created a folder of the same name. Click finish and that will then open up the folder where you will have 4 files in it
  - “SearchInFileSetup.msi”
  - “Setup.exe”
  - “Search In File Installation Guide.pdf”
  - “dotNetFx40\_Full\_setup.exe”

3. If you don't already have .NET Framework already installed on your PC then click on “dotNetFx40\_Full\_setup.exe” and install that 1<sup>st</sup> otherwise click on the “SearchInFileSetup.msi” start our program installation.

4. Run through the installation wizard where most people accept the defaults which will make it a case of just clicking next until you are finished. (Note: it may take a few seconds for the windows user account control for vista and windows 7 users to appear)

5. That should be it now. It will have installed the program into your program files and there should also be a shortcut on your desktop.
